## **Distribution of five hypogeous macromycetes strictly linked to *Eucalyptus camaldulensis* and *Acacia saligna* reforestation in Sicily**

### **Abstract**

La Rocca, S. & Bazan, G.: Distribution of five hypogeous macromycetes strictly linked to *Eucalyptus camaldulensis* and *Acacia saligna* reforestation in Sicily. — Boccone 16(2): 1067-1082. 2003. — ISSN 1120-4060.

Distribution and ecology of five hypogeous or semihypogeous macromycetes species, *Descomyces albus*, *Hydnangium carneum*, *Hysterangium inflatum*, *Labyrinthomyces donkii* and *Setchellilogaster tenuipes*, growing in *Eucalyptus camaldulensis* and *Acacia saligna* reforestation in Sicily are given here.

### **Introduction**

During the last century the Sicilian public administration carried out an intense activity goal oriented to the reforestation of large island areas introducing some species of *Eucalyptus* L'Hér. (Fig. 1) and *Acacia* Miller genera together with typical mediterranean woody species like *Pinus pinea* L., *P. halepensis* Miller and *Cedrus atlantica* (Endl.) Carrière. During the last 40 years some alien species strictly linked to *Eucalyptus* woods, were occasionally introduced with woody species. Starting from 1997 periodic surveys have been carried out in these reforestations to improve the knowledge of Sicilian mycological flora. In this contribution results on hypogeous and semihypogeous macromycetes species, strictly linked to *Eucalyptus camaldulensis* Dehnh. and *Acacia saligna* (Labill.) H. Wendl. (*A. cyanophylla* Lindley) reforestations, are given.

### **Material and methods**

During field exploration, for each taxon ecological data (habitat, substrate, associated plant), fructification period, the localities and municipalities and cartographic references were recorded.

Distributive data are referred to 1:50.000 I.G.M.I. grid map (Official Map of Italian State). All Sicilian territory falls on 63 sheets and according to Padovan (1994), each sheet is also divided in 64 subunits in order to obtain a more detailed distribution map of each

Fig. 1. *E. camaldulensis* reforestation near Corleone (Palermo).

taxon. With this aim a G.I.S. has been prepared, which is a basis for making up a cartographic database of Sicilian macromycetes.

Micromorphological details verified on both from fresh and dried specimens with a Leica Leitz DMLS microscope provided with bright-field optics. Thin, freehand sections from fresh specimens were mounted in a drop of aqueous Congo Red. Dried material has been revived in L4 (Moser 1980) or KOH 5% and then mounted in aqueous Congo Red.

The herbarium samples are kept in the *Herbarium Mediterraneum* (PAL).

## Results

The field surveys carried out in several *Eucalyptus camaldulensis* and *Acacia saligna* reforestations in Sicily, allowed to find the following five hypogeous or semihypogeous species: *Descomyces albus* (Klotzsch) Bouger & Castellano (Fig. 2a), *Hydnangium carneum* Wallroth (Fig. 2b), *Hysterangium inflatum* Rodway (Fig. 2c), *Labyrinthomyces donkii* Malençon (Fig. 2d), and *Setchelliogaster tenuipes* (Setchell) Pouzar (Fig. 2e). For each of the above mentioned species a distribution map in Sicily and a detailed list of records including locality, municipality, province, altitude, ecological data, cartographic reference and date, ordered by Localities, are given.

***Descomyces albus* (Klotzsch) Bouger & Castellano**

This taxon occurs from autumn to the beginning of spring, from the sea level to 780 m. Its presence was recorded in 21 localities distributed in 6 provinces (Map 1). This species seems to be strictly linked to *E. camaldulensis* but one time (Sampieri, Scicli, province of Ragusa) it was recorded in litter of *Acacia saligna*. In Italy, this species has been recorded from Sardinia (Contu & Dessim 1997; Montecchi & Sarasini 2000) and Latium (Montecchi & Sarasini 2000) always within *Eucalyptus* reforestation in sandy soil.

#### ***Hydnangium carneum* Wallroth**

Its occurrence in Sicily was firstly recorded by Venturella & al. (2001) at Ficuzza Wood-Rocca Busambra (Palermo province) in *Eucalyptus camaldulensis* reforestation. During field investigation we have recorded the occurrence, from winter to spring, from the sea level to 780 m in altitude, in 25 localities (Map 2): 22 from *E. camaldulensis* and 3 from pure *Acacia saligna* reforestation. This species seems to be more frequent in the reforestation of the inland and to occur exceptionally in coastal sand dune. The presence of this taxon in Italy has been recorded from Latium (Quadraccia & Lunghini 1990; Migliozzi & Coccia 1987) and Sardinia (Brotzu 1983) always linked to *Eucalyptus*.

Map 2. Distribution of *Hydnangium carneum* in Sicily.

### ***Hysterangium inflatum* Rodway**

The occurrence of *Hysterangium inflatum* in Sicily, firstly recorded by Venturella, La Rocca & Saitta (2001), has been recorded from 21 localities (Map 3) in *Eucalyptus camaldulensis* and *Acacia saligna* pure or mixed reforestation and seems to be more frequent in coastal sand dunes. Two interesting records from Alcamo Marina (TP) and Casa del Bovo Marino (AG) where *H. inflatum* Rodway was found possibly in mycorrhizal relation with *Acacia saligna* as observed by Beaton & al. (1985) about the genus *Acacia*. Montecchi & Sarasini (2000) found *H. inflatum* associated with some *Eucalyptus* species in Sardinia, Lombardia, Latium and Tuscany. Besides Pacioni (1987) recorded it on *Cistus incanus* L. from Apulia and the Molise region.

#### **RECORDS:**

#### ***Labyrinthomyces donkii* Malençon**

*Labyrinthomyces donkii* was firstly reported in Sicily by Venturella & al. (2001) e Venturella & Contu (2002). Here it is reported in 28 new other localities (Map 4) lying between the sea level and 780 altitude, where it has been found in winter and early spring time. This species has also been found at Chiaranda (PA), within a *Pinus halepensis* reforestation, at Alcamo Marina (TP) and Santa Maria del Focallo (Ispica, RG) within *Acacia saligna* plantations. *L. donkii* was also found in Sardinia, Tuscany and Latium within Eucalyptus reforestations (Montecchi & Sarasini 2000).

#### ***Setchelliogaster tenuipes* (Setchell) Pouzar**

*Setchelliogaster tenuipes* la cui presenza in Sicilia era già nota (La Rocca & Anastase 1997; Venturella & al. 2000, 2001; Venturella, La Rocca & Saitta 2001), is the best distributed species, collected in 54 localities (Map 5), from the sea level to 780 m. altitude, in pure or mixed *Eucalyptus camaldulensis* and *Acacia saligna* reafforestation from october to april. Anche in questo caso sono state riscontrate numerose raccolte in associazione ad *A. saligna*. La sua presenza in Italia è segnalata da Migliozi & Coccia (1987) per il Lazio e da Montecchi & Sarasini (2000) per Toscana e Sardegna.

### Conclusion

In conclusion, on the basis of the above field surveys, the hypogeous macromycetes occurring in the *Eucalyptus* and *Acacia* reforestation are: *Descomyces albus*, *Hydnangium carneum*, *Hysterangium inflatum*, *Labyrinthomyces donki* and *Setchellilogaster tenuipes*.

Distributive data show that *Hysterangium inflatum* seems to be more frequent in coastal

sand dunes and *Hydnangium carneum* best presence in the reforestations of the inland. *Setchellio-gaster tenuipes* is the best-distributed species, really common in both *Eucalyptus* reforestation or under isolated trees.

Besides *Hydnangium carneum*, *Hysterangium inflatum* and *Setchellio-gaster tenuipes* reported in literature as mycorrhizic taxa strictly linked to *Eucalyptus* genus. During field investigations we have frequently observed their occurrence linked to *Acacia saligna* in pure or mixed reforestation. According to Beaton & al. (1985) for Victoria State (Australia) and Contu (in litt.) for Sardinia, woody species of *Acacia* seems to replace *Eucalyptus* in mycorrhizic symbiotic relations with hypogeous and epigean macromycetes.

### Acknowledgments

The authors wish to thank prof. F. M. Raimondo for the critical reading manuscript and useful suggestions.

This study has been done within a research project funded by Università degli Studi di Palermo and with financial support of Assessorato Agricoltura e Foreste of Sicilian Region (L.R. 25/93). which is gratefully acknowledged.
