Comparison between two *Eryngium* from Turkey: *E. heldreichii* and *E. davisii*

Abstract

Ecevit Genç, G. & Akalın, E.: Comparison between two *Eryngium* from Turkey: *E. heldreichii* and *E. davisii*. — *Bocconea* 24: 243-247. 2012. — ISSN 1120-4060.

Eryngium heldreichii Boiss. (=*E. bourgatii* subsp. *heldreichii* (Boiss.) Davis) is closely related to *E. davisii* Kit Tan & Yıldız. The main differences are in shorter stem height, prickly petiols, prickly margin of involucral leaves, linear-lanceolate bracts, oblong-obovate fruits without ridges, small vittae in mesocarp and crystals in endocarp.

Introduction

Eryngium L. belongs to *Apiaceae* with about 250 species; it has a cosmopolitan distribution. It is the largest species of the *Apiaceae* and includes about four-fifths of the species of the subfamily *Saniculoideae* Burnett (Pimenov & Leonov 1993). 24 species (46% of the endemics) of *Eryngium* grow in Turkey (Davis 1972, Davis & al. 1988, Duman 2000, Wörz & Duman 2004).

Eryngium is easily distinguished from other members of *Apiaceae* by its capitate inflorescences and a single bracteole per flower. The genus, however, is extremely variable morphologically. Some plants are prostrate and only a few centimetres tall; others are erect and up to 3 m tall. Most species are herbaceous perennials, but many annual species also occur, and even a few are woody. Leaf morphology and venation are also variable. These plants may have long petiolated leaves or sessile ones, with entire to partite blades, entire, setose or spiny margins, and first order venation either pinnate, palmate or even parallel-veined. Involucral bracts at the base of the heads may be showy or indistinguishable from the other floral bracts. Fruits display scales and/or vesicles arranged dorsally. Wolff's (1913) grouped the species into 34 sections and numerous subsections. 12 sections from the Old World and the latter 22 sections from the Americas and Australia. Subsequent taxonomic studies of *Eryngium* have been restricted to plants from specific geographic areas, but have each used Wolff's system of classification. *E. heldreichii* and *E. davisii* belongs to Sect. *Campestria* Wolff.

Eryngium Sect. *Campestria* in Engler, Pflanzenr. IV.228 (Heft 61): 108, 140. 1913.

Perennials, basal leaves trifoliate with trisect to trifid segments, or segments irregularly pinnate or incised, or leaves more or less pinnate; segments mostly decurrent on rachis.

Table 1 Diagnostic characters of *E. heldreichii* and *E. bourgatii*.

Character	<i>E. heldreichii</i>	<i>E. bourgatii</i>
Involucral bracts number and margin	7-12, not spinulose	10-15, spinulose
Sepals	ovate-lanceolate	lanceolate
Basal leaves margin	spinulose	not spinulose
Basal leaves petiole length	up to 20 cm	up to 15 cm
Fruit	oblong	ovoid
Distribution	Asia Minor, Syria	Iberian Peninsula, Morocco

Involucral leaves mostly with an additional whorl of spines at the base of the capitula. Fruits densely covered with long acuminate to filiform, white appendages, ovoid to conical.

Material and Methods

Specimens were collected in the field in 2008-2009. The plant material were identified and deposited in the Herbarium of the Faculty of Pharmacy, Istanbul University (ISTE). For SEM observations dried mature mericarps were mounted on stubs using double-sided

Fig. 1. a. *Eryngium heldreichii* (ISTE 87498); b. *E. davisii* ISTE (87495)

Table 2 Diagnostic characters of *E. heldreichii* and *E. davisii*.

Character	<i>E. heldreichii</i>	<i>E. davisii</i>
Stem	30- tall, branched middle, glaucous	10- tall, branched above, greenish
Basal leaves	orbicular, 1-3 biternatisect, segments lanceolate, spinulose margined, $30-45 \times 50-60$ (-65) mm	\pm suborbicular, 1-3 palmatisect, 3-5 partite, segments tripartite or dentat, spinulose margined, $15-40 \times 17-50$ (-60) mm
Basal leaves petiole	up to tall, not spinulose	(20-) 30- tall, spinulose or occasionally not spinulose
Median cauline leaves	orbicular, 1-3 biternatisect, segments lanceolate, spinulose margined, $30-45 \times 50-60$ (-65) mm	\pm suborbicular, 1-3 palmatisect, 3-5 partite, segments segments tripartite or dentat, spinulose margined, $10-45 \times 10-$
Median cauline leaves petiole	1- tall, not spinulose	10- tall, spinulose
Capitulum	5-18	1-7
Bracteole	linear, 7-	lanseolat-linear, 5-
Fruit	obovat	oblong-obovat
Chromosome number	$2n=16$	$2n=14$
Mericarp (SEM) (Fig. 2)	tuberculate - smooth	colliculate - verrucate
Mericarp in transverse section (Fig. 3)	shape	obovatus-depresse in transverse sections, dorsal ridges prominent, not winged, lateral ridges narrowly winged
	surface	tuberculate
	vallecular vittae	few
	crystals dispersed on endocarp	absent
	Seed	flat on the commissural side
Peduncule in transverse section (Fig. 4)	collenchyma on cortex	13-14 layered on hills, 9-10 layered on hollows
	parenchyma on cortex	7-8 layered on hills, 4-5 layered on hollows
	secretory canal on cortex	33-35
	vascular bundles	33-34
	secretory canal on pith	21-23
		13-14

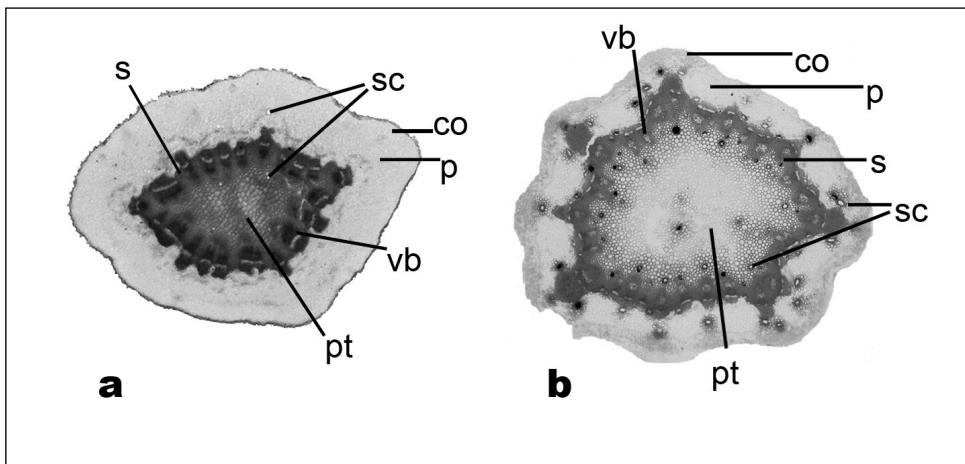

Fig. 2. Peduncle in transverse section: a. *E. heldreichii*; b. *E. davisii* (co: collenchyma, p: parenchyma, pt: pith, s: sclerenchyma, vb: vascular bundles, sc: secretory canals).

adhesive tape. The specimens were examined with Jeol Neoscope JCM-5000 SEM. Terminology of seed-scale surface sculpturing basically follows Stearn (2005). Peduncle and mericarp transverse sections were cut at 7–10 µm with a ice microtome. Slides were stained with a safranin (5%).

Result and Discussion

Eryngium heldreichii is considered as a subspecies (*E. bourgatii* subsp. *heldreichii* (Boiss.) Davis) in Davis (1988). But, according to our surveys, it should be accepted at specific level as indicated in Boissier (1872) and Wörz (2004). The differential characters between *E. heldreichii* and *E. bourgatii* are given in Table 1.

E. davisii is an endemic species close to *E. heldreichii*, and originally included by its spiny winged petiols; spiny margined involucral bracts and oblong-ovovat fruits (Fig. 1). The most important features of *E. heldreichii* and *E. davisii* are given in Fig. 2 and table 2.

Acknowledgements

We thanks to Dr. İlker Genç for his help during our fieldwork & technical support and to As. Prof. Dr Osman Erol for their help and useful suggestions. We also thank İstanbul University (Project Number: 2344). This study is produced from a part of PhD Thesis of first author.
